

Colitis Ulcerosa

Dead Infection

Convulsive spasms make taking food impossible. Large intestine perforation

causes dease. Anatomised reveraibility of phlogistic and ulcerous

transitions increase. Unbearable agony refuses family condolences. Hospital

staff is helpless. A breathing body is undergone the final surgical

intervention. It's too late, anyway. An alien molecule floods e ntails and

burns his final breath. Bowels explosion. A compound of semi-digested food

flows from his mouth.
